

10 Most Annoying PROBLEMS & CHALLENGES with IT Infrastructure

1 Poorly integrated IT system

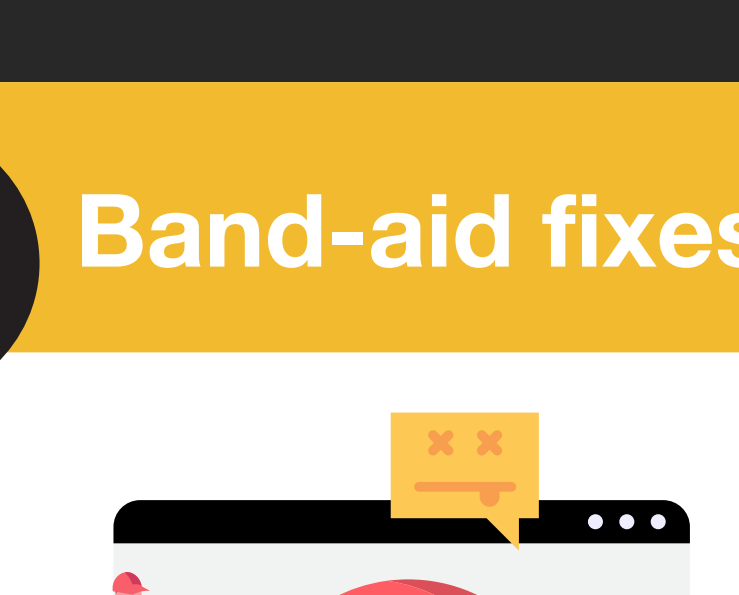

Implementation of new tech without proper planning can mess up your company's database.

Entries may go missing or be recorded twice, making it more tedious for your team.

For a smooth transition, make sure that your preferred application can work well with your current system.

2 No data backups

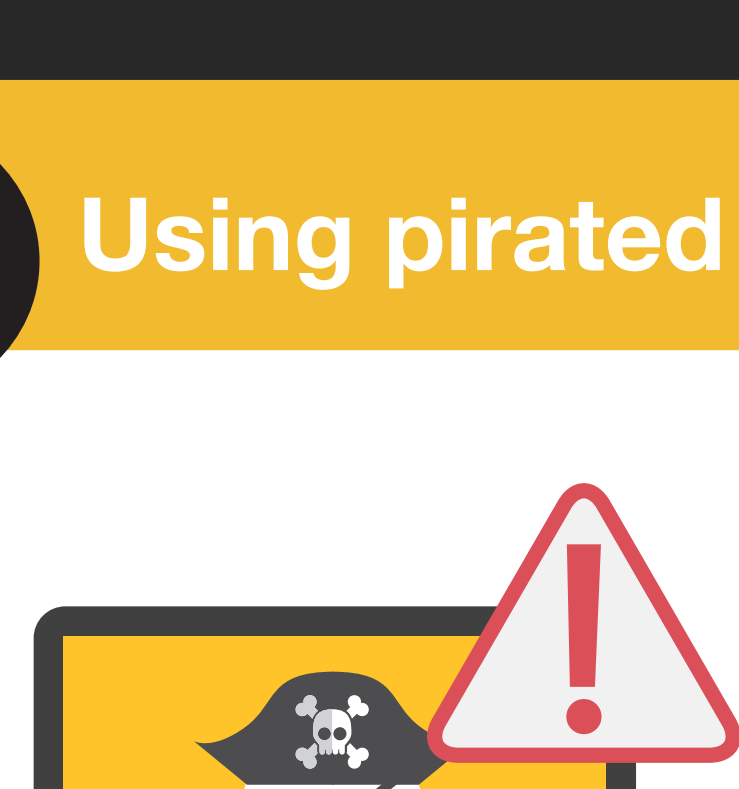

65% of small businesses do not have data recovery protocols in place.

After a critical data loss, research states that 90% of companies fail within two years.

In case of accidental deletion or a server crash, backing up important files will cut down recovery costs and save you time.

3 Band-aid fixes

When faced with technical issues, many companies instinctively look for the fastest or cheapest solution.

However, the most convenient fixes may pave the way for future issues.

Solving IT infrastructure problems by its root will prevent you from accumulating technical debt.

4 Using pirated software

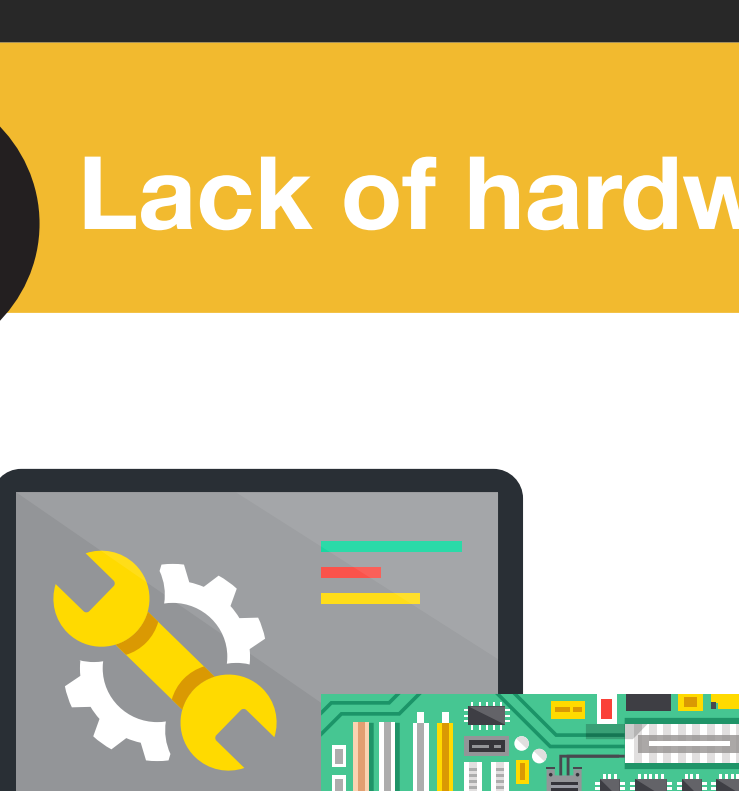

Downloading unlicensed software is no different from asking for a legal battle.

Research shows that over **\$81 million** worth of settlements have been collected over the use of pirated software.

Malware from using unlicensed software costs companies over **\$359 billion** each year.

5 Software Issues

Software problems will prevent employees from maximizing their computers.

Outdated OS or cluttered disk drives are often cause of the problem, so remember to inspect and update every device.

If constant program crashes and slow boot-up times persist, you may require replacements.

6 Lack of hardware maintenance

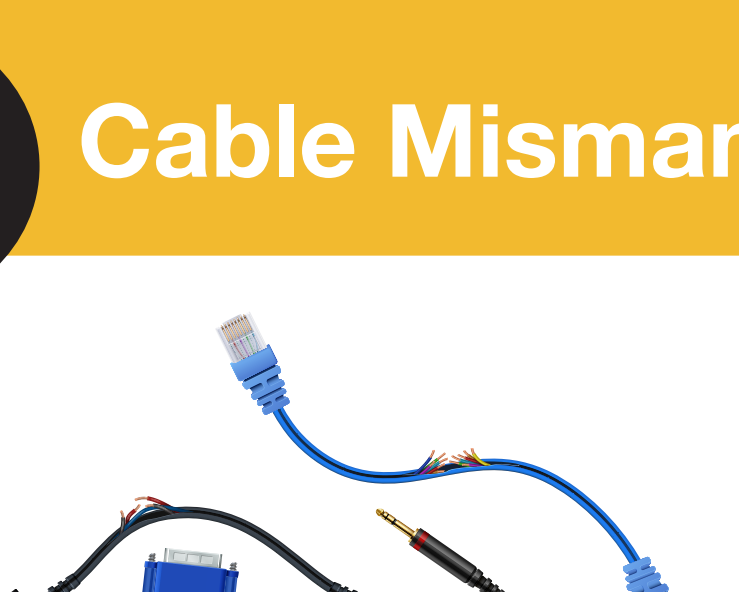

Unexpected hardware breakdown can be very inconvenient.

Repair costs can be more expensive than buying a brand new device.

Taking note of a gadget's lifespan and conducting periodical maintenance will ensure longevity.

7 Security threats

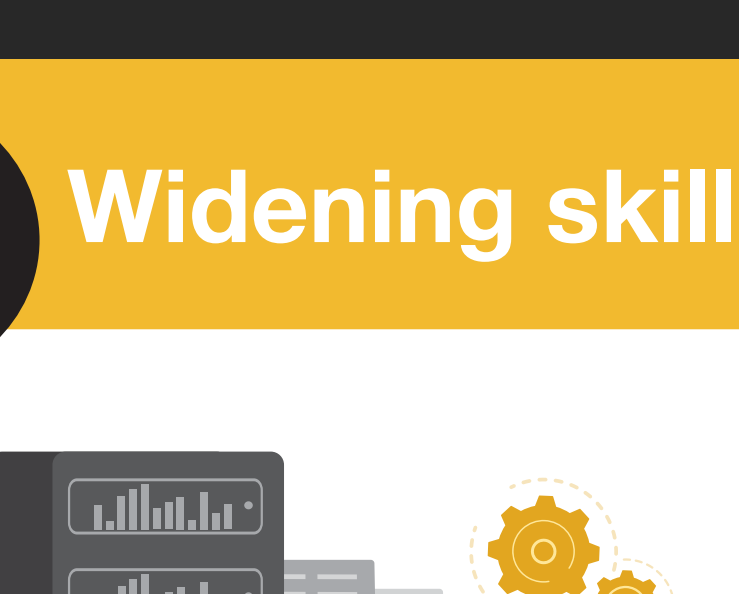

Instances of data breaches have increased in recent years.

In the first half of 2019 alone, over **4.1 billion records** have been exposed to hackers.

Investing in security programs will prevent you from accumulating hefty fines from the **GDPR** and **CCPA**.

8 Cable Mismanagement

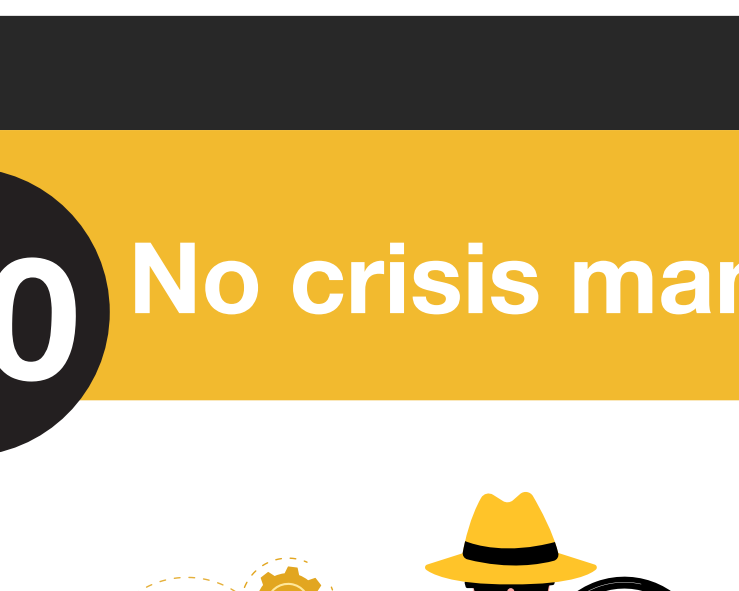

Whether it's for the server room or an employee's computer, tangled cables are an absolute nightmare.

Not knowing a cable's function can be a hassle whenever you're diagnosing connectivity or hardware issues.

Organize and label all cables to make repair and maintenance easier.

9 Widening skills gap

Due to the tightening recruitment race, finding qualified professionals can be a challenge.

Having an IT manager to assist you in data storage and network maintenance will make a big difference in productivity.

For an effective and cost-efficient solution, consider looking at managed IT services.

10 No crisis management protocols

If you fall into a cyberattack, you'll need a crisis management strategy in place.

Failure to be transparent with your clients will lead to distrust and a tarnished market image.

Cooperating with local authorities will allow you to manage your situation in the quickest way possible.
